

Work Report: Sunday, Oct 4, 2026

Member: **Carl Gemuel Taberna (Aelowww)** · Project: Teech

Summary: Fixed the QA bug where emails were not being sent, built the admin console and the ID verification process, and improved sign-up and password recovery. All of this work is **done and live**.

1. QA bug fix: email setup

- **Problem:** students and faculty got no email when an admin approved or rejected their ID, because no email service was set up.
- **Fix:** connected email sending through Gmail, so verification emails now go out.
- Designed branded Teech emails for "You're verified" and "We couldn't verify your ID". The rejection email shows the admin's reason and a button to update details.
- Added matching branded templates for the sign-up code, change-email and reset-password emails.
- Improved the sign-up code popup: a 60-second wait before resending, a note that only the newest code works, and a clearer message for users who haven't confirmed their email.
- Fixed the order of a teammate's database update so the email lookup it repairs works.

2. Admin console

- Secure admin sign-in with a password plus an authenticator-app code.
- Live dashboard with a chart, and separate verification queues for students and faculty.
- The admin console now asks for confirmation before signing out.

3. ID verification

- Students and faculty upload a photo of their school ID for an admin to review.
- Students sign up with only name, email and password, then submit their ID inside the app. Booking unlocks once an admin approves it.
- Faculty can't sign in until an admin approves their ID.
- Users get an in-app notification when they're approved or rejected, and can resubmit after a rejection.
- Existing accounts were marked as already verified so current users aren't locked out.

4. Sign-up and password recovery

- Students and faculty confirm their email with a 6-digit code during sign-up, on mobile and desktop.
- Password reset by email replaces the old security questions, which were removed.
- Confirmation popups that ask you to type a word keep their button disabled until the word is typed.
